

Prince Albert Aerial Lift Certification

Prince Albert Aerial Lift Certification - Aerial Lift Certification is for people who require an in-depth understanding of aerial lift safety. Operators and inspectors, maintenance workers, construction craftsmen and supervisors need to perform a training and certificate program. Federal, provincial and state rules require companies to be certified in order to do in-house aerial lift inspections.

The majority of workers who are required to perform tasks at elevated level will often utilize the same means to get to these desired heights, regardless of the kind of work that must be carried out. Scissor lifts and aerial lifts are the mechanized machines used to be able to lift equipment and employees to elevated places.

Bucket trucks referred to as Cherry Pickers are aerial platforms which feature a supported boom and bucket. The main hazard to making use of this particular type of platform is normally tip-overs, falls and electrocutions. Certification guarantees that workers who utilize aerial lifts are trained properly to be able to operate the machine safely. Training also makes certain that workers know how to maintain aerial work platforms in accordance with the manufacturer's directions.

Aerial lift training certification programs will include the following: Aerial lifts that are mounted to vehicles, Boom-supported aerial lifts and scissors lifts. Trainees will know about safe operating procedures and will gain knowledge about the dangers which usually cause aerial lift accidents. They will be technically competent in the different kinds of aerial lifts, as well as terminology and parts. From interpreting rated capacity charts to choosing the best aerial lift for the task, the certification program will provide employees with all that they need to know to perform their work safely.

Inspectors and supervisors who have the task to check aerial lift machines have to know how to check gears, booms, operating mechanisms, structural components, control systems and functions, power plants, braking systems, attachments, pins and shafts, electric and pneumatic parts, hydraulic, emergency safety devices and operator aids, etc. Training will comprise the following: the role of the inspector in reducing liability exposure and accidents; how to perform a pre-use, annual and monthly check; how to apply and interpret rules regarding aerial lift safety standards; how to write inspection reports; inspection procedures, techniques and checklists; understanding and applying the three levels of aerial lift inspection; complying with record keeping requirements; and when to remove aerial lifts from service if they are defective.
